

BCR FIRE

User Manual

Financial Independence, Retire Early — for everyone

What is BCR FIRE?

BCR FIRE helps you figure out one simple question: *when can I stop working and live off my savings?*

It does the maths for you using your country's real numbers — inflation, investment returns, average living costs — so you see how much money you really need and how to get there.

Educational only. Numbers shown are estimates, not financial advice. Talk to a registered advisor before investing.

What does 'FIRE' mean?

FIRE = Financial Independence, Retire Early. A global movement built on one simple rule:

When your savings are 25× your yearly spending, you can live off them for life. That's the '4% rule'.

Example, very simple:

- You spend **₹14 lakhs / year** on everything (rent, food, school, fuel).
- $25 \times ₹14 \text{ L} = ₹3.5 \text{ crores}$. That's your FIRE number.
- Hit **₹3.5 Cr** → withdraw 4% (**₹14 L**) every year → savings still grow on the other 96%.

The app figures out **your** FIRE number based on where you live and your lifestyle, then shows you how many years it will take.

Quick start — 3 steps

- 1 Tell us about you**
Pick your country, age, and monthly income. You can change these any time by tapping **Edit** at the top of the dashboard.
- 2 Set your lifestyle in Fine-tune**
On the right side of the dashboard pick **Single** or **Family of 4** — the app uses your country's average for that household. If you spend more (or less), type the real number in '*Your annual expenses*'.
- 3 Read your FIRE plan**
Open the **Freedom** tab. The big orange box is your **FI Ratio** — how close you are to FIRE today. Below it are FIRE tiers, charts, and a year-by-year plan.

What each tab does

Overview	Big picture — allocation, FIRE number, expected returns. Start here.
Life plan	Decade-by-decade roadmap: money, health, and relationships from 18 to 90+.
Allocation	Where your money should go: stocks, bonds, gold, real estate, crypto — with reasons.
Funds	Real fund names you can actually buy in your country — index funds, ELSS, ETFs, sukus, etc.
Compounding	A chart showing what your money turns into in 10, 20, 30 years.
Freedom (FIRE)	FIRE number, tiers (Lean / Standard / Fat / Coast), savings-rate chart, year-by-year plan.
Tracker	Save & compare scenarios. Log corpus every quarter to see your real FI Ratio trajectory.
Paths	Side-by-side comparison: disciplined investor vs someone who waits. Eye-opening at age 60.
Crypto	Honest, no-hype crypto guidance for your country: rules, pitfalls, learning links.
Start	Concrete first steps — which account to open, which fund to buy, in what order.
NRI	Only appears if you tick NRI. Indian non-resident options: NRE/NRO/GIFT-City.

The Fine-tune panel

Every slider on the right of the dashboard updates the numbers live:

Savings rate	What % of salary you save each month. Most powerful lever — doubling it roughly halves your years to FIRE.
Target freedom age	Pick when you want to stop working. Younger = bigger SIP needed.
Household	Single or Family of 4. Changes the country expense benchmark.
Your annual expenses	Optional. Type your real number if you know it for best accuracy.
Current invested corpus	What you already have invested today. Counts toward your FI Ratio.

FIRE tiers in plain English

Tier	Multiple	Plain English
LeanFIRE	15× spend	Frugal retirement. Smaller home, public transport, cooking at home. Cheapest exit.
FIRE	25× spend	The classic. Live your current lifestyle indefinitely on 4% withdrawals.
FatFIRE	33× spend	Comfortable. Travel, eat out, hobbies — all included. Uses safer 3% withdrawals.
CoastFIRE	varies	Amount you need today that — even if you stop saving — compounds into the full FIRE number by retirement age.

Key numbers, explained

FI Ratio	Current invested money ÷ today's FIRE number, as a %. Hits 100% = you're free.
FIRE number	Total money you need to retire. Always 25× your yearly spending (inflated to the future if it's a future target).
Required SIP	How much you need to invest every month to hit FIRE by your target age.
Years to FIRE	How many years until your wealth crosses your FIRE number at current savings.
Expected return	What your portfolio earns per year on average. India ~11%, UAE ~8%, US ~8.5%.
Inflation	How fast prices rise per year. Things cost more in 20 years — the app builds that in.
SIP	Systematic Investment Plan. A fixed amount you invest every month, automatically. The FIRE engine.

Pro tips for accurate numbers

- **Be honest about expenses.** Track 3 months of spending and put the average into 'Your annual expenses'. The FIRE number is only as good as this input.
- **Pick the country you'll retire in**, not just where you live now. An NRI in UAE retiring in India should pick India for the FIRE number.
- **Update yearly**, not daily. After every salary raise or big life change (marriage, kids, house).
- **Automate the SIP on payday.** Money you don't see is money you don't spend. People who automate save 3× better.
- **Don't panic-sell during dips.** Compounding rewards consistency. The Paths tab shows what happens to people who do.

Install on your phone

You can install BCR FIRE like a real app — **no app store needed**:

Android Chrome / Edge: tap the *Install* banner at the bottom, or menu (■) → **Install app / Add to Home screen**.

iPhone Safari: tap the **Share** button (box with up-arrow) → **Add to Home Screen**.

Once installed: orange flame icon on your home screen, launches fullscreen, works offline. Your data stays on your device.

Frequently asked questions

Is my data sent anywhere?

No. Everything lives in your browser's local storage. Nothing leaves your phone. Tap *Start over* in the header to wipe it.

I'm an expat — save in one country, retire in another?

For now, pick the country you'll **retire in** — that drives your FIRE number. Use the NRI checkbox if you're an Indian non-resident. A proper dual-country mode is on the roadmap.

Why does my FIRE number look so big?

Inflation. ■14 L today becomes ■36 L in 18 years at 5.5% inflation. The app sizes your corpus for what life will actually cost *then*, not now.

What's a 'good' savings rate?

Whatever you can sustain. Classic FIRE community targets 50%+. Most retail savers do 10–20%. Even moving from 15% → 25% knocks 5–8 years off your timeline.

Should I include my house in 'current corpus'?

No. Only **liquid investments** — mutual funds, stocks, ETFs, fixed deposits, gold ETFs. Your primary home doesn't generate withdrawal income.

The expected return seems high — is that realistic?

It's a 20–30 year nominal average for your country's main index. Short periods will be lower or higher. The 4% rule is built to survive bad decades.

Disclaimer. BCR FIRE is an educational tool by BibinCutRiver. Numbers are illustrative approximations using publicly available country data. **This is not investment advice.** Consult a SEBI / SCA / FCA / SEC-registered advisor before acting. Past performance does not guarantee future returns.
